

KIQ 1.4 — Final Takeaway

What are the strengths and weaknesses of METRO’s own digital app, as seen by its customers?

Method (brief)

Analysis of the unified **METRO app** corpus (METRO Companion + METRO Shop, **n=749** app-store reviews, DE/FR/IT/EN/ES), reused from KIQ 3.3. Sentiment from star ratings; positive and negative reviews classified into thematic categories using the same multilingual keyword method, giving a structured strengths/weaknesses profile rather than a raw word count.

Strengths & weaknesses at a glance

	Theme	Share	Read
Strengths	Works well / satisfied	44%	Core promise is met for those it works for
	Digital card / convenience	20%	The card-in-pocket use case is the loved feature
	Scan / inventory check	10%	Unique strength — no competitor app matches it
Weaknesses	Authentication / Card / Login	32%	The #1 complaint — the same card that delights, fails to log in
	Crashes / Errors / Bugs	23%	Stability is the second structural failure
	Update regressions	11%	Updates break working features

Companion vs Shop — the ordering app is worse

Splitting by app reveals the weakness is concentrated in the **ordering** product: METRO Shop is **80% negative** (vs 58% for Companion). The digital-card/companion experience, while flawed, is less disliked than METRO's actual ordering app. Markets are uniformly low (DE 2.55★, FR 2.48★, IT 2.48★, EN 1.86★) — this is not a single-country problem.

Direct answer to KIO 1.4

METRO's app has a **clear, narrow strength** — it is valued as a digital customer card with scan / availability checking (a use case no competitor app offers) — but this is undermined by **operational weaknesses in exactly that same flow**: authentication / card login (32% of complaints) and crashes (23%). The paradox is central: **the digital card is simultaneously METRO's most-loved feature and its most-broken one**. Only 2% of complaints ask for missing functionality — the problem is reliability, not capability. The weakness is worst in the ordering app (METRO Shop, 80% negative).

Strategic insight

METRO's digital weakness is an execution problem, not a strategy or feature problem. The single highest-ROI action is hardening the digital-card authentication flow and update QA — fixing the most-used, most-broken, most-reviewed function. This is cheaper and faster than any new feature, and it directly converts METRO's 1-star reviews (which deter future adopters) into stars. Strategically, it also protects the one asset competitors cannot copy: the physical-store digital card. New AI/ordering features (the KIT 3 gaps) matter for the platform, but they are wasted spend until the app users already have works reliably.
