

Shiny Integration — Quick Notes

Shiny will mainly use the cleaned datasets and analysis tables to dynamically regenerate and display the visualizations interactively.

Important files to keep for each corpus

- Cleaned dataset (.csv)
- Occurrence table (.csv)
- Co-occurrence table (.csv)
- Optional exported plots (.png / .pdf)

Why datasets are important

Shiny usually rebuilds plots dynamically from the datasets instead of using only static images. This allows filtering, updating, and interactive visualization inside the dashboard.

Simple future Shiny structure

- KIQ 1.1 → Discovery & Interaction
 - Occurrence plot
 - Co-occurrence network
 - Interpretation text
- KIQ 1.1 → Ordering & Fulfillment
 - Occurrence plot
 - Co-occurrence network
 - Interpretation text

Shiny is mainly the visualization and interaction layer for the SCI analyses already produced.
